# Web Test Automation Framework– iplt20.com

## 1. Introduction

This assignment will help you practice and demonstrate your skills in building a real-time Automation Testing Framework. The goal is not just to automate a test case, but to understand how to design a proper framework that is**:**

- Well-structured
- Reusable
- Easy to maintain
- Scalable for future test cases

## 2. Objective

The goal is to automate critical user journeys on the IPL website to ensure data accuracy and functional stability. You are required to implement the Page Object Model (POM) to separate the page-specific locators and actions from the actual test logic.

## 3. Technical Stack

- Language: Java (JDK 17+)
- Build Tool: Maven
- Automation Tool: Selenium WebDriver (v4.x)
- Testing Framework: TestNG
- Design Pattern: Page Object Model (POM)
- Version Control System: Git

## 4. Project Requirements:

- Project Structure: strictly follow the standard Maven directory structure to ensure consistency and compatibility with CI/CD pipelines.
- Dynamic Waits: prefer using Dynamic waits
- Utility classes: create utility classes for common actions to improve the re-usability
- Abstraction: Page classes should only contain By locators and methods that perform actions.

- TestNG XML: Use a testng.xml file to trigger the test suite execution.
- Clean Code: Follow Java naming conventions (camelCase for methods, PascalCase for classes).
- Screenshots: Capture the screenshots for the failed steps and store it in the repo for debugging purposes.
- Cross browser support: should be able to run the tests in chrome and edge browsers, create separate testNG.xml files for each browser.

## 5. Sample Test Cases to Automate You are required to automate the following 4 scenarios:

### Test Case 01: Verify footer links

1. Navigate to https://www.iplt20.com/.

2. Scroll to the bottom of the page

3. Verify the footer links present in each section (TEAM,ABOUT,GUIDELINES and CONTACT)

### Test Case 02: Verify Team Details

1. Navigate to https://www.iplt20.com/.

2. Click on the "Teams" tab in the navigation menu.

3. For each team verify the following (use the Data driven approach by storing the expected details for each team in a provided from another method)

4. Verify that the team logo is displayed 5. Assertion2: On hovering on the team logo, Verify that it shows the list of years the team has won the title

### Test Case 03: Points Table Validation

1. Navigate to the "Stats" or "Points Table" section.

2. Retrieve the name of the team currently at Rank 1.

3. Assertion: Verify that the "Matches Played" and points values are correct

### Test Case 04: Search Functionality (News)

1. Navigate to the "News" section.

2. Use the search icon/bar to search for "Auction 2026".

3. Verify that the search results contain at least one article related to the 2026 Auction
